

Internship Task - Basic Calculator

What the project does

This project is a simple console-based calculator written in Python. It allows the user to perform basic arithmetic operations such as addition, subtraction, multiplication, and division between two numeric inputs.

How to run or test it

1. Save the code in a file named `calculator.py`.
2. Open a terminal or command prompt and navigate to the folder where the file is located.
3. Run the program by executing: `python calculator.py`
4. Follow the on-screen prompts to enter two numbers and select an arithmetic operation.
5. The result will be displayed on the screen.

Dependencies or instructions

This project requires:

- Python 3.x installed on your system

No external libraries or packages are needed.
